Netflix Dataset – Data Preparation for Business Analytics and Reporting

1. Objective

The objective of this project is to prepare the Netflix dataset for business analytics and reporting. The dataset was cleaned and standardized using Python and the Pandas library to ensure that it is accurate, consistent, and suitable for further analysis.

2. Tools Used

- Python
- Pandas
- Google Colab
- CSV

3. Data Preparation Process

Step 1: Dataset Import

The Netflix dataset was imported into Python using the Pandas library and the read_csv() function.

Step 2: Missing Values

Missing values were identified using Pandas. Appropriate text fields such as Director, Country, Rating, Duration, and Date Added were handled by replacing missing entries with "Unknown" where appropriate.

Step 3: Duplicate Records and Formatting

Duplicate records were identified and removed. Extra spaces and inconsistent text formatting were also corrected.

Step 4: Standardization

The following columns were standardized:

- **Type:** Standardized values such as Movie and TV Show.

- **Rating:** Standardized capitalization and spacing.
- **Country:** Standardized spacing around country separators and removed unnecessary spaces.

Step 5: Export

After completing the cleaning process, the final dataset was exported as:

Netflix_Cleaned.csv

4. Outcome

The resulting dataset is clean, consistent, and ready for business analytics and reporting. It can be used for further analysis of Netflix content by type, country, rating, release year, genre, and other business dimensions.

5. Conclusion

The data-cleaning process improved the quality and consistency of the Netflix dataset. Using Python and Pandas provided an efficient and reproducible approach to preparing the data for further business intelligence and reporting activities.
