Key Findings

The analysis of the Netflix dataset shows that Movies represent the majority of the available content.

- The dataset contains **8,790 total titles**.
- There are **6,126 Movies**, representing approximately **69.70%** of the dataset.
- There are **2,664 TV Shows**, representing approximately **30.30%** of the dataset.
- Movies outnumber TV Shows by approximately **2.30 to 1**.
- The visualizations clearly demonstrate that Netflix has a significantly higher proportion of Movies than TV Shows in this dataset.

Business Insight

The high proportion of Movies indicates that the Netflix content library in this dataset is more heavily focused on movie content. However, TV Shows still represent approximately one-third of the library, making them an important component of Netflix's overall content offering.

These findings can help support further analysis of content strategy, including genre distribution, country-wise production, ratings, release-year trends, and the growth of Movies versus TV Shows.
